

SEROTEK PRESENTS KEYS FOR K-12

JULY 1, 2008

For children in the 21st century, using a computer is as basic as learning to read or riding a bike. Serotek Corp. is introducing a program today that will put blind children on the same page with their sighted peers – giving them the ability to use a computer anytime, anywhere, with help from Keys for K-12.

Imagine your blind child at a friend's house, and the sighted friend wants to demonstrate a cool new site on the internet or work on a shared science project. Until now, blind kids just felt left out while the other kids looked at the screen.

Now imagine that your child reaches into his backpack or pocket, pulls out a thumb drive, and says, "Hey, let's plug in my key so I can play, too."

Keys for K-12 means a free license to carry the System Access Mobile capabilities on a U3-enabled USB thumb drive. With the SA Mobile software, your student can plug her flash drive into any computer anywhere and have instant access – through text-to-speech and/or magnification – to all Windows-based applications already there.

At school, the library, Grandma's house, or a sleepover, a blind child can access the same information on the computer as any sighted student who can see the screen.

A licensed copy of System Access Mobile sells for \$499.00, and now student K-12 can have it for free!

What you need to do: Complete the eligibility forms for each student (which include certification of visual impairment from medical and educational professionals), follow the simple steps to download the System Access Mobile software to a USB drive – and your student is ready to go. To get started visit:
